

From forecasting model to a reliable live service

A working system for training, deploying, monitoring and improving store-level demand forecasts.

DELIVERED OUTCOMES

- Ready to use
- Monitored
- Recoverable

CONTROLLED BUSINESS SCENARIO

Promotion effectiveness gradually declines; the system detects the impact and evaluates retraining.

-12.9%

forecast error in historical testing

-6.1%

error for affected stores after retraining

VERIFIED

safe updates, recovery and cloud storage

CLIENT RISK

Forecast models often stop at notebooks. Without controlled updates, reliable delivery and ongoing checks, teams may notice declining forecast quality too late.

ENGINEERED RESPONSE

New models are compared with the current version, released with all required data, checked after deployment and rolled back automatically if something fails.

DATA

FEATURE ENGINEERING

MODEL TRAINING

MODEL REGISTRY

FORECAST API

MONITORING

RETRAINING

Evidence from the working system

Executed workflows and measured results

Automated model delivery

From data checks to a verified deployment

Measured improvement after retraining

Impact checked separately for affected store groups

Operational safeguards and runtime evidence

SAFE UPDATES

Verified release checks and rollback

RELIABLE STORAGE

Models and history survive service restarts
